# Gradient methods for conditional problems. Projected Gradient Descent. Frank-Wolfe method. Idea of Mirror Descent algorithm.

#### Daniil Merkulov

Optimization for ML. Faculty of Computer Science. HSE University

#### Unconstrained optimization

$$\min_{x \in \mathbb{R}^n} f(x)$$

• Any point  $x_0 \in \mathbb{R}^n$  is feasible and could be a solution.

**♥** ೧ **Ø** 

#### Unconstrained optimization

$$\min_{x \in \mathbb{R}^n} f(x)$$

• Any point  $x_0 \in \mathbb{R}^n$  is feasible and could be a solution.

**♥** ೧ **Ø** 

#### Unconstrained optimization

$$\min_{x \in \mathbb{R}^n} f(x)$$

• Any point  $x_0 \in \mathbb{R}^n$  is feasible and could be a solution.

#### Constrained optimization

$$\min_{x \in S} f(x)$$

• Not all  $x \in \mathbb{R}^n$  are feasible and could be a solution.

Conditional methods

#### Unconstrained optimization

$$\min_{x \in \mathbb{R}^n} f(x)$$

• Any point  $x_0 \in \mathbb{R}^n$  is feasible and could be a solution.

### Constrained optimization

$$\min_{x \in S} f(x)$$

- Not all  $x \in \mathbb{R}^n$  are feasible and could be a solution.
- The solution has to be inside the set S.

7 O 0

#### Unconstrained optimization

$$\min_{x \in \mathbb{R}^n} f(x)$$

• Any point  $x_0 \in \mathbb{R}^n$  is feasible and could be a solution.

### Constrained optimization

$$\min_{x \in S} f(x)$$

- Not all  $x \in \mathbb{R}^n$  are feasible and could be a solution.
- The solution has to be inside the set S.
- Example:

$$\frac{1}{2}||Ax - b||_2^2 \to \min_{\|x\|_2^2 \le 1}$$

#### Unconstrained optimization

$$\min_{x \in \mathbb{R}^n} f(x)$$

• Any point  $x_0 \in \mathbb{R}^n$  is feasible and could be a solution.

### Constrained optimization

$$\min_{x \in S} f(x)$$

- Not all  $x \in \mathbb{R}^n$  are feasible and could be a solution.
- The solution has to be inside the set S.
- Example:

$$\frac{1}{2}||Ax - b||_2^2 \to \min_{\|x\|_2^2 \le 1}$$

#### Unconstrained optimization

$$\min_{x \in \mathbb{R}^n} f(x)$$

• Any point  $x_0 \in \mathbb{R}^n$  is feasible and could be a solution.

#### Constrained optimization

$$\min_{x \in S} f(x)$$

- Not all  $x \in \mathbb{R}^n$  are feasible and could be a solution.
- The solution has to be inside the set S.
- Example:

$$\frac{1}{2}||Ax - b||_2^2 \to \min_{\|x\|_0^2 \le 1}$$

Gradient Descent is a great way to solve unconstrained problem

$$x_{k+1} = x_k - \alpha_k \nabla f(x_k) \tag{GD}$$

Is it possible to tune GD to fit constrained problem?

#### Unconstrained optimization

$$\min_{x \in \mathbb{R}^n} f(x)$$

• Any point  $x_0 \in \mathbb{R}^n$  is feasible and could be a solution.

#### Constrained optimization

$$\min_{x \in S} f(x)$$

- Not all  $x \in \mathbb{R}^n$  are feasible and could be a solution.
- The solution has to be inside the set S.
- Example:

$$\frac{1}{2}||Ax - b||_2^2 \to \min_{\|x\|_2^2 \le 1}$$

Gradient Descent is a great way to solve unconstrained problem

$$x_{k+1} = x_k - \alpha_k \nabla f(x_k) \tag{GD}$$

Is it possible to tune GD to fit constrained problem?

Yes. We need to use projections to ensure feasibility on every iteration.

Conditional methods

### **Example: White-box Adversarial Attacks**

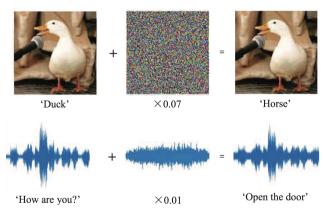

Figure 1: Source

• Mathematically, a neural network is a function  $f(\boldsymbol{w};\boldsymbol{x})$ 

P O 0

### **Example: White-box Adversarial Attacks**

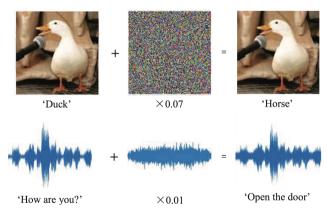

Figure 1: Source

- Mathematically, a neural network is a function  $f(\boldsymbol{w};\boldsymbol{x})$
- $\bullet$  Typically, input x is given and network weights w optimized

**⊕ ೧ ⊘** 

### **Example: White-box Adversarial Attacks**

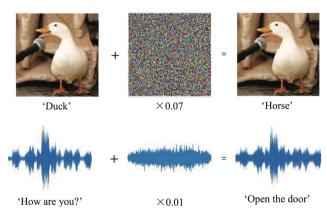

Figure 1: Source

- Mathematically, a neural network is a function f(w;x)
- $\begin{tabular}{ll} {\bf Typically, input} & x \end{tabular} & s \end{tabular} & s \end{tabular} & and network weights \\ & w \end{tabular} & optimized \\ \end{tabular}$
- $\begin{tabular}{ll} \bullet & \begin{tabular}{ll} Could also freeze weights $w$ and optimize $x$, adversarially! \end{tabular}$

$$\min_{\delta} \mathsf{size}(\delta) \quad \mathsf{s.t.} \quad \mathsf{pred}[f(w; x + \delta)] \neq y$$

or

$$\max_{\delta} l(w; x + \delta, y) \text{ s.t. size}(\delta) \leq \epsilon, \ 0 \leq x + \delta \leq 1$$

Conditional methods

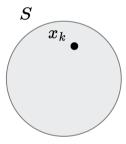

Figure 2: Suppose, we start from a point  $x_k$ .

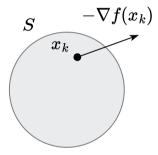

Figure 3: And go in the direction of  $-\nabla f(x_k)$ .

Conditional methods  $\nabla$  O

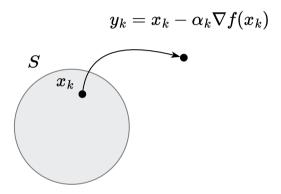

Figure 4: Occasionally, we can end up outside the feasible set.

Conditional methods

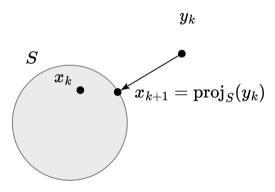

Figure 5: Solve this little problem with projection!

Conditional methods

$$x_{k+1} = \operatorname{proj}_{S} (x_k - \alpha_k \nabla f(x_k))$$
  $\Leftrightarrow$   $y_k = x_k - \alpha_k \nabla f(x_k)$   $x_{k+1} = \operatorname{proj}_{S} (y_k)$

$$\alpha b - \alpha b + \alpha^2 c^T c - \alpha^2 c^T c = 0 \ge 0$$

### Idea

$$x_{k+1} = \operatorname{proj}_{S}(x_k - \alpha_k \nabla f(x_k))$$
  $\Leftrightarrow$   $y_k = x_k - \alpha_k \nabla f(x_k)$   
 $x_{k+1} = \operatorname{proj}_{S}(y_k)$ 

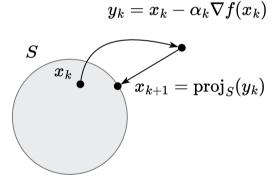

Figure 10: Illustration of Projected Gradient Descent algorithm

#### i Theorem

Let  $f: \mathbb{R}^n \to \mathbb{R}$  be convex and differentiable. Let  $S \subseteq \mathbb{R}^n$ d be a closed convex set, and assume that there is a minimizer  $x^*$  of f over S; furthermore, suppose that f is smooth over S with parameter L. The Projected Gradient Descent algorithm with stepsize  $\frac{1}{L}$  achieves the following convergence after iteration k > 0:

$$f(x_k) - f^* \le \frac{L||x_0 - x^*||_2^2}{2k}$$

#### **i** Theorem

Method: 
$$= f(x_k) - L\langle y_k - x_k, x_{k+1} - x_k \rangle + \frac{L}{2} ||x_{k+1} - x_k||^2$$

Cosine rule: 
$$= f(x_k) - \frac{L}{2} \left( \|y_k - x_k\|^2 + \|x_{k+1} - x_k\|^2 - \|y_k - x_{k+1}\|^2 \right) + \frac{L}{2} \|x_{k+1} - x_k\|^2$$
 (7)

#### i Theorem

Let  $f:\mathbb{R}^n\to\mathbb{R}$  be convex and differentiable. Let  $S\subseteq\mathbb{R}^n$ d be a closed convex set, and assume that there is a minimizer  $x^*$  of f over S; furthermore, suppose that f is smooth over S with parameter L. The Projected Gradient Descent algorithm with stepsize  $\frac{1}{L}$  achieves the following convergence after iteration k > 0:

$$f(x_k) - f^* \le \frac{L||x_0 - x^*||_2^2}{2k}$$

#### Proof

1. Let's prove sufficient decrease lemma, assuming, that  $y_k = x_k - \frac{1}{L}\nabla f(x_k)$  and cosine rule

 $2x^Ty = ||x||^2 + ||y||^2 - ||x - y||^2$ :

Smoothness:  $f(x_{k+1}) \le f(x_k) + \langle \nabla f(x_k), x_{k+1} - x_k \rangle + \frac{L}{2} ||x_{k+1} - x_k||^2$ 

 $= f(x_k) - L\langle y_k - x_k, x_{k+1} - x_k \rangle + \frac{L}{2} ||x_{k+1} - x_k||^2$ Method:

 $= f(x_k) - \frac{L}{2} \left( \|y_k - x_k\|^2 + \|x_{k+1} - x_k\|^2 - \|y_k - x_{k+1}\|^2 \right) + \frac{L}{2} \|x_{k+1} - x_k\|^2$  (7) Cosine rule:  $= f(x_k) - \frac{1}{2L} \|\nabla f(x_k)\|^2 + \frac{L}{2L} \|y_k - x_{k+1}\|^2$ 

2. Now we do not immediately have progress at each step. Let's use again cosine rule:

$$\left\langle \frac{1}{L} \nabla f(x_k), x_k - x^* \right\rangle = \frac{1}{2} \left( \frac{1}{L^2} \| \nabla f(x_k) \|^2 + \| x_k - x^* \|^2 - \| x_k - x^* - \frac{1}{L} \nabla f(x_k) \|^2 \right)$$
$$\left\langle \nabla f(x_k), x_k - x^* \right\rangle = \frac{L}{2} \left( \frac{1}{L^2} \| \nabla f(x_k) \|^2 + \| x_k - x^* \|^2 - \| y_k - x^* \|^2 \right)$$

2. Now we do not immediately have progress at each step. Let's use again cosine rule:

$$\left\langle \frac{1}{L} \nabla f(x_k), x_k - x^* \right\rangle = \frac{1}{2} \left( \frac{1}{L^2} \| \nabla f(x_k) \|^2 + \| x_k - x^* \|^2 - \| x_k - x^* - \frac{1}{L} \nabla f(x_k) \|^2 \right)$$
$$\left\langle \nabla f(x_k), x_k - x^* \right\rangle = \frac{L}{2} \left( \frac{1}{L^2} \| \nabla f(x_k) \|^2 + \| x_k - x^* \|^2 - \| y_k - x^* \|^2 \right)$$

3. We will use now projection property:  $||x - \text{proj}_S(y)||^2 + ||y - \text{proj}_S(y)||^2 \le ||x - y||^2$  with  $x = x^*, y = y_k$ :

$$\begin{aligned} \|x^* - \mathsf{proj}_S(y_k)\|^2 + \|y_k - \mathsf{proj}_S(y_k)\|^2 &\leq \|x^* - y_k\|^2 \\ \|y_k - x^*\|^2 &\geq \|x^* - x_{k+1}\|^2 + \|y_k - x_{k+1}\|^2 \end{aligned}$$

2. Now we do not immediately have progress at each step. Let's use again cosine rule:

$$\left\langle \frac{1}{L} \nabla f(x_k), x_k - x^* \right\rangle = \frac{1}{2} \left( \frac{1}{L^2} \| \nabla f(x_k) \|^2 + \| x_k - x^* \|^2 - \| x_k - x^* - \frac{1}{L} \nabla f(x_k) \|^2 \right)$$
$$\left\langle \nabla f(x_k), x_k - x^* \right\rangle = \frac{L}{2} \left( \frac{1}{L^2} \| \nabla f(x_k) \|^2 + \| x_k - x^* \|^2 - \| y_k - x^* \|^2 \right)$$

3. We will use now projection property:  $||x - \operatorname{proj}_S(y)||^2 + ||y - \operatorname{proj}_S(y)||^2 \le ||x - y||^2$  with  $x = x^*, y = y_k$ :

$$||x^* - \operatorname{proj}_S(y_k)||^2 + ||y_k - \operatorname{proj}_S(y_k)||^2 \le ||x^* - y_k||^2$$

$$||y_k - x^*||^2 > ||x^* - x_{k+1}||^2 + ||y_k - x_{k+1}||^2$$

4. Now, using convexity and previous part:

Convexity: 
$$f(x_k) - f^* \le \langle \nabla f(x_k), x_k - x^* \rangle$$
$$\le \frac{L}{2} \left( \frac{1}{L^2} \|\nabla f(x_k)\|^2 + \|x_k - x^*\|^2 - \|x_{k+1} - x^*\|^2 - \|y_k - x_{k+1}\|^2 \right)$$

Sum for i=0,k-1  $\sum_{i=0}^{k-1} [f(x_i)-f^*] \leq \sum_{i=0}^{k-1} \frac{1}{2L} \|\nabla f(x_i)\|^2 + \frac{L}{2} \|x_0-x^*\|^2 - \frac{L}{2} \sum_{i=0}^{i-1} \|y_i-x_{i+1}\|^2$ 

5. Bound gradients with sufficient decrease lemma 7:

$$\sum_{i=0}^{k-1} [f(x_i) - f^*] \le \sum_{i=0}^{k-1} \left[ f(x_i) - f(x_{i+1}) + \frac{L}{2} \|y_i - x_{i+1}\|^2 \right] + \frac{L}{2} \|x_0 - x^*\|^2 - \frac{L}{2} \sum_{i=0}^{i-1} \|y_i - x_{i+1}\|^2$$

$$\le f(x_0) - f(x_k) + \frac{L}{2} \sum_{i=0}^{i-1} \|y_i - x_{i+1}\|^2 + \frac{L}{2} \|x_0 - x^*\|^2 - \frac{L}{2} \sum_{i=0}^{i-1} \|y_i - x_{i+1}\|^2$$

$$\le f(x_0) - f(x_k) + \frac{L}{2} \|x_0 - x^*\|^2$$

$$\sum_{i=0}^{k-1} f(x_i) - kf^* \le f(x_0) - f(x_k) + \frac{L}{2} \|x_0 - x^*\|^2$$

$$\sum_{i=0}^{k} [f(x_i) - f^*] \le \frac{L}{2} \|x_0 - x^*\|^2$$

6. Let's show monotonic decrease of the iteration of the method.

- 6. Let's show monotonic decrease of the iteration of the method.
- 7. And finalize the convergence bound.

$$\begin{aligned} y_k &= \arg\min_{x \in S} f_{x_k}^I(x) = \arg\min_{x \in S} \langle \nabla f(x_k), x \rangle \\ x_{k+1} &= \gamma_k x_k + (1 - \gamma_k) y_k \end{aligned}$$

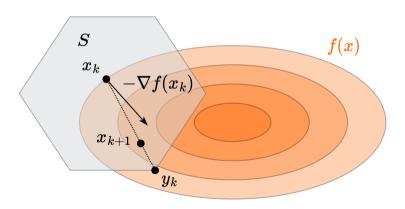

Figure 18: Illustration of Frank-Wolfe (conditional gradient) algorithm

# Convergence (1/2)

#### Consider the problem

$$f(x) \to \min_{x \in S}$$

where f is convex and L-smooth. The Frank-Wolfe method is given by:

$$\begin{cases} x_{k+1} = \gamma_k x_k + (1 - \gamma_k) s_k \\ s_k = \arg\min_{x \in S} f_{x_k}^I(x) = \arg\min_{x \in S} \langle \nabla f(x_k), x \rangle \end{cases},$$

where  $f_{x_k}^I(x)$  is the first-order Taylor approximation at the point  $x_k$ . For  $\gamma_k = \frac{k-1}{k+1}$ , it holds that

$$f(x_k) - f(x^*) \leqslant \frac{2LR^2}{k+1},$$

where  $R = \max_{x,y \in S} ||x - y||$ . Thus, we have sublinear convergence.

-Wolfe Method

# Convergence (2/2)

*L*-smoothness:

$$f(x) - f(y) - \langle \nabla f(y), x - y \rangle \leq \frac{L}{2} ||x - y||^{2}, \quad \forall x, y \in S$$

$$f(x_{k+1}) - f(x_{k}) \leq \langle \nabla f(x_{k}), x_{k+1} - x_{k} \rangle + \frac{L}{2} ||x_{k+1} - x_{k}||^{2}$$

$$= (1 - \gamma_{k}) \langle \nabla f(x_{k}), s_{k} - x_{k} \rangle + \frac{L(1 - \gamma_{k})^{2}}{2} ||s_{k} - x_{k}||^{2}$$

 $f(x) - f(y) - \langle \nabla f(y), x - y \rangle \ge 0 \quad \forall x, y \in S \Rightarrow \quad x := x^*, y := x_k \Rightarrow \langle \nabla f(x_k), x^* - x_k \rangle \le f(x^*) - f(x_k)$  $f(x_{k+1}) - f(x_k) \le (1 - \gamma_k) \langle \nabla f(x_k), x^* - x_k \rangle + \frac{L(1 - \gamma_k)^2}{2} R^2 \le (1 - \gamma_k) (f(x^*) - f(x_k)) + (1 - \gamma_k)^2 \frac{LR^2}{2}$ 

Convexity:

$$f\left(x_{k+1}\right) - f(x^*) \leqslant \gamma_k \left(f(x_k) - f(x^*)\right) + (1 - \gamma_k)^2 \frac{LR^2}{2}$$
 Denote  $\delta_k = \frac{f(x_k) - f\left(x^*\right)}{LR^2}$ . Then the inequality can be rewritten as

$$\delta_{k+1} \leqslant \gamma_k \delta_k + \frac{(1-\gamma_k)^2}{2} = \frac{k-1}{k+1} \delta_k + \frac{2}{(k+1)^2}.$$

Starting from the inequality  $\delta_2 \leqslant \frac{1}{2}$ , applying induction on k yields the desired result.
